This invention describes a novel method of determining a predisposition to disease by genotyping a subject's DNA sequence (A) of the human mismatch repair gene, MSH6 at specified positions and comparing with reference DNA sequences, optionally taking into account all possible combinations of variations of the individual mutations, including any chosen absolute number of variations. (A), and analysis of their sequences, are useful for the following: (i) determining an increased mutation rate (frequency of base substitutions, insertions and/or deletions) in eukaryotic cells; (iii) predicting the progression, severity and survival time of patients with neoplastic disease; (iv) the development of therapeutic and 'life-style' choplastic disease; (iv) the development of therapeutic and 'life-style' drugs; (v) predicting individual differences in response to known chemotherapeutic agents (e.g. cis-platin) or drugs developed from (iv); (vi) optimizing individual treatments and interventions against neoplasia; (vi) controlling the mutation rate in eukaryotic cells, in
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Novel variants of the human mismatch repair gene, MSH6, useful e.g. for determining predisposition to cancer and for development of drugs -
                 2-5A-antisense oligonucleotide chimeric molecules, the antisense region targets the chimeric molecule to a particular region of RNA to be specifically cleaved and the 2',5'-linked tetraadenylate tail activates the 2-5A RNBse. Typical applications are treatment of viral infections (esp. for cleavage of an RNA virus genome), cancer; leukaemia, cardiovascular disorders (e.g. restenosis after angiography), genetic disorders, osteoarthritis or rheumatoid
                                                                                                                                                                                                                                                                                                            Gaps

vitro or in vivo; (viii) constructing genes and vectors, particularly for development of pharmaceuticals; (ix) developing diagnostic kits and other systems for genotyping; and (x) developing in vivo and in vitro test systems for expressing individual forms of the MSH6 gene, e.g. for studying pathophysiology of disease or processes in which MSH6 is involved, and for drug development and testing.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                DNAc comprising a promoter P and an L1 cassette sequence having a core retrotransposon element, useful for random insertion of a heterologous or homologous DNA sequence into a cell genome and for correcting
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            The present invention relates to DNA for a promoter and an Il cassette sequence having a core retrotransposon element. The invention is useful for random insertion of a heterologous or homologous DNA sequence into a cell genome, and for correction of a genetic defect in the cell into which the insertion is made. Genetic defects which may be corrected includes cystic fibrosis, mutations in the dystrophin gene, genetic defects associated with blood clotting and
                                                                                                                                                                               Gaps

The synthetic oligomer is capable of forming a triplex at physiological pH with a purine rich target sequence by coupling into the major groove of the duplex. The specific target sequence of this oligomer is the human interleukin 6 gene untranslated sequence contg. a purine rich sequence concd. on one strand of the duplex. The oligomer, and others like it are useful in diagnosis and therapy of diseases characterised by specific DNA duplex targets, e.g. HPV, HER, HIV, hepatitis B, herpes, malignant tummours and inflammation. The triple helices form under mild conditions thus assays may be carried out without subjecting the test specimen to harsh conditions. The oligomer contains an inverted polarity region formed from an o-xyloso dimer synthon. The linking gp. is o-xyloso
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     New oligomers contg. modified bases - which form a triplex with G-C doublet in a DNA duplex, for treating and diagnosing HIV, hepatitis, herpes, malignancy and inflammation

AAR62941 and AAR62942 are examples of synthetic immunoreactive peptides. They are used in a method for detecting an antigen in a subject. The method involves binding the antigen to a solid support and then reacting it with an immunoreactive ligand (L) bound to an oligo; removing any unreacted L, and then detecting the presence of the oligo. A similar method can be used to detect Abs, in which case the ligand is an oligo-labelled Ag. The use of an amplifiable oligo as the label allows Ag or Ab to be detected at very low levels. An exemplary olgi is AAQ75024 which can be covalently attached by the 5'-terminat to the N- or C-terminal of a synthetic peptide. For LCR using oligo AAZ75024, oligos 1-4 (see AAQ75027-Q75030) can be used. (Updated on 25-MAR-2003 to correct PN field.)
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Solid phase immunoassay using oligo:nucleotide as label - also new conjugates of oligo:nucleotide coupled to antigenic peptide, partic. for diagnosing hepatitis C or E virus infection

(nucleotides have the 3'positions of xylose sugars linked via the o-xylene ring). Two nucleotides are coupled through a xylene residue to form the dimer synthon. This additional modifications may render the oligomer stable to nuclease activity. The oligomer is able to inhibit gene expression, as verified by in vitro systems.                                                                                                                                                                                                                                                                                               AAR62941 and AAR62942 are examples of synthetic immunoreactive peptides. They are used in a method for detecting an antigen in a subject. The method involves binding the antigen to a solid support and then reacting it with an immunoreactive ligand (L) bound to an oligo; removing any unreacted L, and then detecting the presence of the oligo. A similar method can be used to detect ABs, in which case the ligand is an oligo-labelled Ag. The use of an amplifiable oligo as the label allows Ag or Ab to be detected at very low levels. An exemplary olgi is AAQ75024 which can be covalently attached by the 5'-terminus to the N- or C-terminal of a synthetic peptide. For LCR using oligo AAZ75024, oligos 1-4 (see AAQ75027-Q75030) can be used. (Updated on 25-MAR-2003 to correct PN field.)

transcription of tissue or cell derived mRNA, in the method of the transcription of tissue or cell derived mRNA, in the method of the invention is a molecular indexing method, and comprises digesting the cDNA amplified by these sequences with a class IIS restriction enzyme. Each resultant CDNA fragment is then lighted to a biotinylated adaptor (selected from a pool of 64 adaptors cheesive to all possible overhangs), and digesting the products with two further class IIS restriction enzymes. These steps are repeated (but therrent class IIS restriction enzymes. These steps are repeated (but therrent class IIS restriction enzymes. These steps are repeated (but therrent class IIS restriction enzymes. These steps are repeated (but therrent class IIS restriction samples are then recovered using streptavidin-coated paramagnetic beads, removing the strand complementary to an adaptor-primer. The adaptor primer and an anchored complementary to an adaptor-primer. The adaptor primer and include an analysis samples. The amplified products are separated, and the sizes of the fragments obtained is recorded. The method can be used for the cDNA samples. The adaptore is a second as a cancers or viral infections, for the search and isolation of the genes of physiologically active substances that are potential pharmaceuticals, or causative genes of hereditary diseases, as well as for the isolation of genes for improving agricultural products. Using this method, it is possible to classify (index) DNA into groups in a short period of time without duplication.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Aromatic acyl transferase; transformation; anthocyanin pigment; plante; acylation; colour; tone; colouration; colour change; Gentiana triflora; Petunia hybrida; Perilla ocimoides; Scenecio cruentus; Lavandula angustifolia; se.

DNA coding for aromatic acyl transferase - for transforming which produce anthocyanin pigments and thus altering colour e.g. of flowers

Example 2; Page 21; 94pp; Japanese.

Vectors containing DNA fragments encoding proteins of plant origin with aromatic acyl transferase activity may be used to transform plants which produce anthocyanin pigments. The aromatic acyl transferase acylates the pigments in the flower resulting in colour tone changes and allowing new colourations to be produced. Six specific DNA sequences encoding aromatic acyl transferase from different plants are described in AAT37308-T37313. This primer was used to reverse transcribe aromatic acyl transferase RNA to produce a cDNA ready for cloning into expression vectors

Determination of gene expression levels - using combinations different cDNA samples tagged with different PCR adaptors

Example 2; Page 9; 22pp; English.

The present sequence represents a primer which was used to synthesise Apolipoprotein DDNA in a RT-PCR reaction. This primer as well as primers AAV61554 and AAV61556 were added to both mouse liver-derived and mouse kidney-derived total RNA to generate single-stranded cDNA. These

ö primers were used in the method of the invention to determine the amount ratio between a cDNA coding for mouse liver-derived Apoliopprotein and a cDNA that codes for the mouse kidney-derived Apoliopprotein by using Adaptor-tagged Competitive PCR (ATAC-PCR). This method allows gene expression to be quantitatively determined, and because internal standards are not required to prepare a calibration curve, it is a quicker and less laborious process. This primer as well as primers AAV61555 and AAV61556 were added to both mouse liver-derived and mouse kidney-derived total RNA to generate single-stranded CDNA. These primers were used in the method of the invention to determine the amount ratio between a CDNA coding for mouse liver-derived Apolipoprotein and a Adaptor-tagged Competitive PCR (ATAC-PCR). This method allows gene expression to be quantitatively determined, and because internal standards are not required to prepare a calibration curve, it is a

The present invention is concerned with the cleavage of nucleic acids from solid supports. This is carried out by adding a non-conventional nucleotide into the nucleic acid attached to the support, so that it is recognised and cleaved by a specific DNA glycosylase and the sequence is released. This is useful in many molecular biological procedures such as sequencing, in vitro amplifications, cDNA and template preparation, DNA-based assays, mutagenesis procedures, nucleic acid purification and affinity chromatography. The present sequence is an oligonucleotide used in assays to demonstrate the methods of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Nucleic acid cleavage; solid support; affinity chromatography; sequencing; mutagenesis; DNA preparation; nucleic acid purification; ss

```

The present invention is concerned with the cleavage of nucleic acids from solid supports. This is carried out by adding a non-conventional nucleotide into the nucleic acid attached to the support, so that it is recognised and cleaved by a specific DNA glycosylase and the sequence is released. This is useful in many molecular biological procedures such as sequencing, in vitro amplifications, CDNA and template preparation, DNA-based assays, mutagenesis procedures, nucleic acid purification and affinity chromatography. The present sequence is an oligonucleotide used in assays to demonstrate the methods of the invention. 1.5%; Score 17; DB 1; Le 100.0%; Pred. detection method involves hybridizing probe opposite to objective out of fractional gene cluster Gene gene

Example 1; Page 9; 11pp; Japanese.

The present invention describes a gene detection method which comprises fractionating using a probe opposite to the objective gene which is hybridised out of fractioned gene cluster. The objective gene detected belongs to the group of objective genes contained in the sample. The method is used for gene detection by fractionation of cDNA by molecular index method using specific primer. It provides high detection sensitivity of objective gene. AAA08407 to AAA08414 represent oligonucleotides used in the exemplification of the present invention.

protecting plants such as crop plants from pest and/or pathogen

PCR primers AAF85495-97 were used to amplify a DNA fragment encoding ralata B1. Kalata B1 is a macrocyclic peptide with diverse biological activities. The Kalata B1 polymucleotide represents a nucleic acid molecule of the invention. The specification describes nucleic acid molecules which encode an amino acid sequence which is capable of being cyclised within a cell or a membrane of a cell to form a cyclic backbone. The amino acid sequence comparises sufficient disulfide bonds to confer a stabilized folded structure on the three-dimensional structure of the backbone. The nucleic acid molecules of the invention are useful for broducing transgenic genetically modified food or non-food crop plants, producing transgenic genetically modified food or non-food crop plants, producing transgenic genetically modified food or non-food crop plants, introduce modulating activity, for modulating activity of calcium channel binding is useful in treatment of pain or stroke and CSa binding activity useful as an antibiliflammatory agent. The nucleic acid molecules are useful in the generation of molecules having animal or plant therapeutic properties as well as in a range of diagnostic, industrial adjuntational agricultural including horicultural applications and for an adjunctural including horicultural applications and for

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              The present invention provides oligonucleotides, and methods for their use, which are useful in modulating the action of proteins involved in gastric acid production. The target protein is preferably the histamine H2 receptor or one of the proteins which form part of the gastric proton pump. The sequences and methods of the invention are useful in the tractment of gastric rellux, gastritis, dyspepsia, stomach ulcers, duodenal ulcers and other gastric acid disturbances, most of which are caused by Helicobacter pylori.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Treating gastric acid disturbance by administering an oligonucleotide which modulates the activity of a polypeptide involved in gastric acid
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Gaps

The invention relates to a method for calibrating data scanned from a molecular array. The method involves employing calibration probes that generate signals proportional to the total concentrations of labelled target molecules to which the molecular array probes are directed over an entire range of sample solutions and molecular arrays incorporating sets of calibration probes. Method is useful for calibrating different types of signals scanned from a molecular array, or calibrating signals scanned from a molecular array. The present sequence is poly (A) normalisation probe used in calibration of molecular array data.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Gaps

                                                                                                                                                                                                                                                                                                                                                                                                        The present invention relates to nucleic acid probes, which are useful for assaying nucleic acids by hybridising with a target nucleic acid, in which a single-stranded oligonucleotide is labelled with a fluorescent substance and a quencher in a manner that the fluorescence intensity of the hybridisation reaction system is increased after completion of the hybridisation but no stem loop structure is formed. The probes are useful for assaying nucleic acids and their polymorphism and mutation, particularly useful for e.g. analytical applications, disease diagnosis and microbial identification. The present sequence was used to illustrate the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  This invention describes a novel method for testing the effect of a substance as a preventive or treating agent for osteoporosis or arthro-rheumatism. This sequence represents a PCR primer used in the amplification of a gene encoding a protein associated with osteoporosis or arthro-rheumatism which is described in the disclosure of the
                                                                                                                                                                  Fluorescently-labeled nucleic acid probes for assaying nucleic acids and their polymorphism and mutation, particularly useful in science and medicine for e.g. analytical applications, disease diagnosis and microbial identification
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Murine osteoporosis/arthro-rheumatism associated gene PCR primer DAPA1.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Preventing or treating an agent for osteoporosis or arthro-rheumatism

The protein transfers a sugar to the 3' position canthocyanin, and can be used for changing the colour of flowers. The present sequence is a PCR primer used to isolate glycosyltransferase coding sequences of the invention.

The present sequence is a DNA probe used in a novel method of analysis or assay for nucleotides, which comprises: (i) digesting DNA with a DNA fragments obtained around the 3' termini with a DNA probe and extending the DNA probe by a complementary strand synthesis to fractionate the DNA fragments into groups; and (iii) measuring lengths of the DNA fragments which belong to the groups, or length of the extended DNA probe, and using the lengths obtained for the fragments around the 3' termini as fingerprints. Where polyA is present presence of recognition sequence GGG is critical for clarifying the terminal site, this is because the length of polyA cannot be controlled. The method is useful for assaying long DNA fragments and for assaying long DNA sequences.

The present invention additionally discloses an agonist of phosphatase 79 for therapeutic use, and an antibody which specifically binds to human phosphatase 79. Human phosphatase 79, and nucleotides which encode it may be used for treating a variety of diseases, such as malignant tumours, blood diseases, HIV (human immunodeficiency virus) infection, immune disorders and inflammatory conditions. The protein may also be used to screen for modulators of its
                                                                                                                       The specification describes a support for immobilizing nucleotides which contributes to the efficient clarification of DNA without damagin the terminal parts of the DNA. The support is a chemically treated modified substrate on which oligonucleotides with restriction enzyme cleavage sites are immobilised. The support is useful for immobilizing nucleic acids such as DNA. The present sequence represents a synthetic oligonucleotide used in the course of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Human phosphatase 79 and encoded polynucleotide, applicable in diagnosis and treatment of malignant tumor, hemopathy, HIV infection, immunological diseases and various inflammation

activity or for peptide fingerprinting identification. The polynucleotide can be used as a primer for nucleic acid amplification reaction or as a probe for hybridisation reactions, or in producing gene chips or microarrays. Sequences AAH24265-AAH34266 represent reverse transcription-PCR (RT-PCR) primers used in an exemplification of the invention to isolate human phosphatase 79 cDNA.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      The invention relates to performing a thermal cycle of PCR by using a substrate on which a deoxyribonucleic acid (DNA) is immobilized. The method is useful in the medical, biochemical, molecular biological and genetic engineering fields. Sequences ABQ79871-881 represent PCR primers used in the method of the invention.

The invention relates to systems for identification and characterisation of gene expression in one or more samples, comprising an identimer having a specific oligo-dT primer sequence, where the identimer comprises a cetectable marker at its 5' and. The system is useful for identifying any cor all genes expressed in a given in vivo or in vitro RNA sample, as well genes expressed in a given in vivo or in vitro RNA sample, as well cet size, for supporting discovery of new genes, and for identifying mRNAs that are expressed at different levels between 2 or more samples. The new system or method addresses limitations of prior methods by comprising compositions and systems are linked to DNA or RNA sequence databases for optimal resource efficiency in assaying gene compositions and systems are linked to DNA or RNA sequence databases for optimal resource efficiency in assaying gene expression. The system has the following advantages over existing cortions in the needed to enable the assay; (b) provides immediate sequence information in addition to information corlone library construction is not needed to enable the assay; (b) provides immediate sequence information in addition to information level and mRNA identification in neassay; (c) generates CDNA fragments from all mRNAs present in the sample for subsequent investigation by common molecular biology cortexing significant genomic sequence in formation. The present corganisms lacking significant genomic sequence in formation. The present subsequence represents an oligo dT primer used in the method of the
                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Identifying and characterizing gene expression in samples, for identifying mRNAs expressed at different levels, comprises employing an identimer having a oligo-dT primer of a specific sequence and a detectable marker at its 5' end -
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           ..

```
The present invention relates to human S4 ribosomal protein 13.97 (see ABB83379). The ribosomal protein and its coding sequence are useful for treating malignant tumours, hemopathy, HIV infection, immunological diseases and various inflammations. The present sequence is a PCR primar, which was used in an example from the invention.

The invention relates to human gonadotropin-releasing hormone 10 (AAAM49158) and to nucleic acids encoding it (ABL55128). The protein has a molecular weight of 10 kD. The invention also relates to a method for the recombinant production of the protein, an antagonist of the protein, and the use of the protein, gene and antagonist in therapeutic applications. Gonadotropin-releasing hormone 10 can be used in the treatment of a variety of diseases such as cancer and HIV (human
                                                                                                                                                                            The invention relates to a method for calibrating data scanned from a molecular array. The method involves employing calibration probes that generate signals proportional to the total concentrations of labelled target molecules to which the molecular array probes are directed over an entire range of sample solutions and molecular arrays incorporating sets of calibration probes. Method is useful for calibrating different types of signals scanned from a molecular array, or calibrating different scanned from different arrays. The present sequence is poly (A) normalisation probe used in calibration of molecular array data.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Polypeptide-human gonadotropin-releasing hormone 10 and polynucleotide encoding it -

Identifying a candidate polymorphic repeat within a coding sequence, for understanding or treating genetic disease, comprises detecting tandem repeats in a target coding sequence and scoring the repeats for polymorphic probability -

Examples; Column 579; 588pp; English.

The invention discloses a method for identifying a candidate polymorphic repeat within a coding sequence (expressed sequence tag, EST), which comprises detecting tandem repeats in a target coding sequence, scoring the repeats for polymorphic probability and generating a dataset correlating the repeats with polymorphic probability to identify a candidate polymorphic repeat. The computational methods (polymorphic marker prediction of ubiquitous simple sequences, poNROUS, and Rep-X) are useful for identifying and detecting candidate polymorphic repeats in human genes, which can be used to understand, treat or eliminate genetic diseases linked to nucleotide repeats are Machado-Joseph, Haw River syndrome, Huntington's disease, fragile-X syndrome, Fredreich's ataxis, myotonic dystrophy, hyperandrogenaemia, spinal and bulbar atrophy and spinocerebellar ataxia. The sequences presented in ABX79676-ABX80022 are the polymorphic repeats identified for a search of human ESTs.

AAZ37411, AAZ37472, AAZ37740 and AAZ37741 are used in the exemplification of the present invention. The present invention describes novel nucleotide antisense compounds, targetted to the 5' untranslated, translation termination codon, or 3' untranslated region of a nucleic acid encoding human mdm2, that modulates expression of human mdm2. The oligonucleotides mediate their effect by antisense inhibition of hyperproliferative gene expression. The antisense compound is used to treat an animal having a disease or condition associated particularly a hyperproliferative condition, more particularly a hyperproliferative condition, more particularly cancer, especially of the blood, brain, breast, lung or soft tissue, or psoriasis, fibrosis, atherosclerosis or restenosis.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             New antisense compounds used to treat eg. hyperproliferative conditions

the present invention.

. 0

The invention is directed to BAP28 polypeptides, BAP28 polynucleotide sequences and regulatory region located at the 3' and 5' ends of the PAP28 collagragion. The BAP28 polypeptides can be expressed by standard recombinant methodology BAP28 polymerlectides and polypeptides have been found to be over expressed in prostate tumour cells, therefore levels of BAP28 expression and/or activity may be assayed (e.g. by polymerase chain reaction (PCR)) to diagnose patient suffering from c susceptible to prostate cancer. Antibodies specific for the BAP28 polypeptides are useful as diagnostic reagents. Biallelic markers of the BAP28 gene are useful in genetic analysis. Sequences AAP83934-963 represent primers for the BAP28 gene and PCTA-1 gene (the coding strand of BAP28). New BAP28 polynucleotides and polypeptides overexpressed in prostate cancer cells for diagnosing prostate tumors, e.g. by hybridization or polymerase chain reaction assays -Gaps . 0 tumour; cancer; diagnostic; genetic analysis; Length 20; Indels Chumakov I, Cohen-Akenine A; BAP28 gene fragment amplifying primer BAP28polyTcourt. AC AAFE Matches RESULT 55 AAF83959/ à 셤 ò g The present invention relates to antisense compounds, 8-30 nucleobases in length targeted to the 5' untranslated region, translation termination codon region, 3' untranslated region, translation translation at expisers of a nucleic acid encoding human mdm2, where the antisense compound modulates the expression of human mdm2. The antisense compound modulates the expression of human mdm2. The manisense oligonuclectides of the invention are useful for encoding human mdm2 and for inhibiting the expression of human mdm2. They may be used for treating an animal having a disease or condition associated with amplification of mdm2 gene or overexpression of mdm2. They may be used for treating an animal having a disease or condition associated with a soft tissue cancer) and psoriasis, fibrosis, atherosclerosis or restenosis, tunnours, colorectal carcinoma and chronic myelogenous cettemosis, tunnours, colorectal carcinoma and chronic myelogenous compound reduces hyperproliferation of human cells. The method, which involves the use of the antisense compound, is also useful for detecting the role of mdm2 expression in various cell functions and physiological processes and useful in both clinical research and diagnostic tools.

AAS29244-AAS39507 represent the human mdm2 antisense oligonucleotides

The invention relates to an isolated polypeptide, comprising a variant form of mouse or human SAC1 polypeptide. The variant form is associated with altered preference for carbohydrates, other sweeteners or ethanol. The polypeptide and its associated DNA sequence can be produced by recombinant techniques and is useful for preventing obesity, diabetes or alcoholism associated with SAC1 expression. The sequences are useful in screening for drugs and sweeteners. Recombinant cell lines and transgenic embryos may be used in screening for and identifying agents that induce or repress function of SAC1. Predisposition to diabetes, obesity or alcoholism can be ascertained by testing any fluid or tissue of a human (such as blood, pancreas or tongue) for sequence variations of the SAC1 locus may indicate a predisposition to diabetes, obesity and/or alcoholism and may provide a diagnostic mark. The polymuclectide can be detected in a biological sample by contacting the DNA with a probe to form a hybridisation complex
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Human; mouse; SAC1; carbohydrate; sweetener; ethanol; alcoholism; ss;

potentially useful for treatment of cancer, where the inhibitor is active on a gene vital for cell growth or viability, and where the gene is subject to loss of heterozygosity (Loh) in a cancer. The inhibitor is used for preventing the development of cancer in a patient having a precancerous condition, by administering to the patient a first allele specific inhibitor (ASI) targeted to an allele of a first essential gene present in cells of the precancerous condition, where the normal somatic cells of the patient are heterozygous for the first gene, the inhibitor is active on at least one but less than all allelic forms of the gene
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              present in a population and targets only one allelic form present in the normal somatic cells, and the first gene. The products and methods can be used in the diagnosis, prevention and treatment of LOH disorders,
                                                                                                                                                     Identifying target genes for allele-specific drugs - used for diagnosis, prevention and treatment of, e.g. cancers, atherosclerotic plague, dysplastic lesions, endometriosis or graft versus host disease
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Human; single nucleotide polymorphic; SNP; forensic science; paternity testing; phenotypic trait; genetic mapping; animal breeding; plant breeding; ds.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                e.g. cancers, atherosclerotic plaques, premalignant metaplastic or dysplastic lesions, benign tumours, endometriosis, polycybric kidney disease, and graft versus host disease. The method can also be used tremove malignant cells from bone marrow transplants. AAZ25812-Z26825
                                                                                                                                                                                                                                                                                                                            This invention describes a novel method for identifying an inhibitor
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         represent human polymorphic sites described in the method of the
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       /*tag= a

                                                                                                                                                                                                                                                                                                                                                                                                                                                 The invention relates to an isolated polypeptide, comprising a variant form of mouse or human SAC1 polypeptide. The variant form is associated with altered preference for carbohydrates, other sweeteners or ethanol.

The polypeptide and its associated DNA sequence can be produced by recombinant techniques and is useful for preventing obesity, diabetes or alcoholism associated with SAC1 expression. The sequences are useful in screening for drugs and sweeteners. Recombinant cell lines and transgence embryos may be used in screening for and identifying agents that induce or repress function of SAC1. Predisposition to diabetes, obesity or alcoholism can be ascertained by testing any fluid or tissue of a human (such as blood, pancreas or tongue) for sequence variations of the SAC1 of gene. A sequence variation of the SAC1 locus may indicate a predisposition to diabetes, obesity and/or alcoholism and may provide a diagnostic mark. The polymuclectide can be detected in a biological sample by contacting the DNA with a probe to form a hybridisation complex which is then detected. The sequence represent cDNA encoding human and mouse SAC1 polypeptides and PCR primers specific for the SCA1 genes.

The present invention relates to human oligonucleotides comprising a single nucleotide polymorphic site (SNP: AAH88797-AAH89219). The present sequence is one such oligonucleotide. The oligonucleotides can be used in forensics, paternity testing, correlation of polymorphisms with phenotypic traits, genetic mapping of phenotypic traits and marker assisted breeding of animals and crop plants. New polymorphic sites derived from the human genome are useful to determine sites correlating with phenotypic traits, particularly disease, and also in forensics and paternity testing Sequence 21 BP; 3 A; 9 C; 4 G; 5 T; 0 other; Thomas D; Claim 27; Page 7; 43pp; English Chen J, Patil N, (AFFY-) AFFYMETRIX INC WPI; 2001-335945/35 Au Κ,

New polynucleotide homologous with a portion of one strand of the human FEZ1 gene, useful for alleviating abnormal cell proliferation such as cancer

Example 1; Page 103; 255pp; English.

AAA64539-50 represent donor and acceptor sites of the human FEZ1 gene. FEZ1 is a tumour suppressor gene, located at chromosome location 8p22. Decreased or no expression of FEZ1 is detected in a variety of cancer cells. Expression of FEZ1 inhibits tumour growth and proliferation. FEZ1 also interacts with tubulin, with microtubules,

and with protein EFI-gamma. Post-translational phosphorylation and dephosphorylation modulates the effect of the FEZI protein.
Inhibitors of FEZI gene expression are useful for inducing cells to proliferate. Compounds which modulate FEZI association with tubulin are useful for alleviating tubulin hyper- or hypo- polymerisation disorders, such as those associated with aberrant initiation of mitosis, modulation of the initiation and rate of cell proliferation and cell growth, modulation of cell shape, cell rigidity, cell motility rate and stage of cellular DNA replication; intracellular distribution of organelles, metastatic potential of cell and cellular transformation from a non-cancerous to cancerous phenotype. Compounds which modulate FEZI binding and phosphorylation are also useful for and metastatic such as tumorigenesis, tumour survival, growth and metastasis. 8X333333333333333X8

Recombinant production of (pro)collagen having correct folding using vectors encoding collagen sub:unit and collagen post-translational enzyme respectively

Example 10; Page 57; 90pp; English

This primer is used to mutate a plasmid pBS(SK-) by PCR by introducing a NotI site upstream of the initiation codon for human prolyl 4-hydroxylase alpha subunit. This is used in the construction of recombinant vectors containing collagen polypeptide enzymes. A novel method for producing a (pro) collagen polypeptide comprises culturing a host cell, where the host expression vector comprising a polynuclectide molecule having a mucleic acid sequence which encodes a (pro) collagen subunit and a second expression vector comprising a polynuclectide molecule having a nucleic acid sequence which encodes a (pro) collagen molecule having a nucleic acid sequence which encodes at least one (pro) collagen post-translational

888888888888888

```
enzyme or enzyme subunit. The (pro)collagen polypeptide is then purified from the cultured cell. The (pro)collagen polypeptide is selected from collagen types IV, V. IV. VII., IX, X. XI, XII, XII, XIV, XV, XV, XVI, XVII, XVIII, and XIX. The methods can be used for the production of collagens such as human collagens which can be used in therapeutic applications. The method provides for the synthesis of correctly folded proteins so that they exhibit the normal triple-helical conformation characteristic of procollagens and collagens. Purification of the collagens is greatly facilitated.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Human; translation initiation factor subunit e1F4E binding protein 17.27; publy development malformation; tumour; diabetes; menoxenia; peptic ulcer; translation initiation factor; e1F4E; binding protein; PCR; primer; 85.

New polypeptide-human translation initiation factor subunit eIF4E binding protein 17.27 for treating embryo development malformation, tumors, diabetes, menoxenia, and peptic ulcer

Example 3; Page 20 (Disclosure); 33pp; Chinese.

The present invention relates to human translation initiation factor subunit eIP4E binding protein 17.27 (see ABB83427). The protein and its coding sequence are useful for treating various diseases, such as embryo development malformation, tumours, diabetes, menoxenia, peptic ulcer, etc. The present sequence is a PCR primer, which was used in an example from the invention

Sequence 24 BP; 3 A; 0 C; 3 G; 18 T; 0 other;

harsh conditions.

The synthetic oligomer is capable of forming a triplex at physiological pH with a purine rich target sequence by coupling into the major groove of the duplex. The specific target sequence of this oligomer is the human tumnour necrosis factor receptor mRNA beginning at nucleotide 234 contg. a purine rich sequence concd. on strand of the duplex. The oligomer, and others like it are useful in diagnosis and therapy of diseases characterised by specific DNA tumnours and inflammation. The triple helices form under mild conditions thus assays may be carried out without subjecting the test specimen to

                                                                                                                                                                                                                                                                                                                                                                                        The present invention describes a method of producing binary sequence tags from nucleic acid fragments in a sample, involving incubating the sample with cleaving reagents, mixing offset adaptors with the sample, incubating with more cleaving reagents and mixing the sample with adaptors where the adaptors are coupled to binary sequence tags. The method is useful in sequence analysis, including analysis and comparison of gene expression, nucleic acid samples and genomes.
                                                                                                                                                                                                                                                                                                                            Producing binary sequence tags, useful for analyzing nucleic acid sequence tags, gene expression or gene-expression patterns, involves generating nucleic acid fragments, which are mixed with offset adaptors

The methods can be used to detect SNPs for use in population genetics, drug development, forensics, cancer, genetic disease research, genomic analysis, diagnostics and therapeutics in
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       The sequence is a second reverse phase triplex forming oligonucleotide, RP-TFO (3' to the SNP) used to analyse Factor V Leiden SNP using the method of the invention. The invention relates to analysing target nucleic acid sequences comprising restricting isolated DNA, hybridising at least one triplex forming oligonucleotide (TFO), adding a 3' to 5' exonuclease to form a protected nucleic acid sequence (DNAS) tail structure, hybridising the captured structure with a single nucleotide polymorphisms (SNP) identification probe and determining the SNP score. The methods can be used for analysing target nucleic acid sequences,
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           genetics, drug development and diagnosing cancer, comprises hybridizing triple forming oligonuclectide and probe to target sequence -
reverse phase triplex forming oligonucleotide, RP-TFO; protected nucleic acid sequence; PNAS; single nucleotide polymorphism; SNP; short tandem repeat; cancer; Factor V Leiden SNP; ss.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      0;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Analysing target nucleic acid sequences, useful for population
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Length 20;

The invention relates to diagnosis of hepatitis B virus (HBV) infection stages comprising identification of full length HBV transcripts (I) and truncated HBV transcripts (II) in a serum sample, where the ratio of I:II is indicative of a particular infection stage. The method is useful for diagnosing HBV infection stages and determining the risk for developing hepatocellular carcinoma. The present sequence is that of a HBV diagnostic PCR primer, useful for the invention.
                                                                                                                                                              Diagnosing hepatitis B virus (HBV) infection stages and determining the risk for hepatocellular carcinoma, comprises identifying full length HBV transcripts and truncated HBV transcripts in a serum sample
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Deletion sequence oligonucleotide; sensor array; eukaryotic pathogen; probe; cellular adhesion modulator; cellular proliferation modulator; human retrovirus; non-human retrovirus;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             This invention describes a novel composition comprising a number of sensor arrays, where each array comprises a unique probe oligonuclectide, which is the reverse complement of part of a unique
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            New compositions comprising sensor arrays made up of unique probe oligonucleotides - useful for characterizing a sample of target

(b) pouring a mixed developing solvent composed of a buffer made from a volatile salt and a water soluble organic solvent at a suitable concentration gradient into the column;

(c) pouring an acid, particularly 6-16 v/v* acetic acid, into the column to deprotect the oligonucleotides protected with the hydrophopic group;

(d) pouring a mixed developing solvent composed of a buffer made from a hydrogencarbonate solution adjusted at pl# 8-10, and a water soluble organic solvent at a suitable concentration gradient to elute the deprotected oligonucleotides; and
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Hepatitis B virus; HBV; infection; hepatocellular carcinoma; diagnosis;
                                                                                                                                                                                                                                                                                                                                                                                                                    The present sequence is an oligonuclectide provided in a specification relating to the simplified purification of oligonuclectides by liquid chromatography. The process comprises:

(a) pouring oligonuclectides protected with a hydrophobic group and oligonuclectide with no protective group into a liquid chromatography column packed with an acid and alkali resistant packing agent, such
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  .

target oligonucleotide present in a mixture of target deletion sequence oligonucleotides. The compositions form a method for characterizing a sample of target deletion oligonucleotides which are labelled and hybridize with the probe oligonucleotides of the sensor arrays. Such oligonucleotides and their targets are represented in AAX23548-X23709 oligonucleotides and their targets are represented in AAX23548-X23709 oligonucleotides characterized by the method form pharmaceutical compositions that are useful for modulating cellular adhesion or proliferation, and being active against a eukaryotic pathogen, a human retrovirus, including influenza virus, Epstein-Barr virus, Respiratory Syncytial Virus or cytomegalovirus (CMV). The compositions enable characterization of deletion sequence oligonucleotides having related, but different nucleobase sequences, and quantification of different species of deletion sequence ("target") oligonucleotides in a mixture. Also, if the specificity of the oligonucleotide's nucleobase sequence con in the reverse complement is not modified, the method may be performed
                                                                                                                                                                                                                                                                                                                                                                                ó

                                                duplex formation, between an oligonucleotide and a target nucleic acid (NA), comprising incubating the target NA with a modified oligonucleotide (T) comprising a homopolymeric sequence having a modification which decreases or abrogates H-bonding between the modified oligonucleotide and the non-specific target NA. The modified homopolymeric sequence and a non-homopolymeric target sequence. It is used to increase the proportion of full length cDNA clones for a library, to reduce mispriming during sequencing, 5' or 3' RACE (rapid amplification of cDNA ends) or DNA synthesis or to generate bona fide
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                The present invention describes a method (M1) for producing a human antibody phage display library (1), comprising: (1) providing a nonhuman transgenic animal (II) whose genome comprises human immunoglobulin genes; (2) isolating nucleic acids encoding human antibody chains (III) from lymphatic cells; and (3) forming a library of display packages whose members comprise a nucleic acid encoding (III) which is displayed from the package. The method is used for producing a human antibody display
                                     invention describes a method for destabilising non-specific
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  transgenic animal whose genome comprises human immunoglobulin genes and isolating nucleic acids encoding antibody chains from lymphatic cells -

Ö library, e.g., a Fab phage display library. The display method may be used to screen nucleic acids encoding antibody chains obtained from immunised nonhuman transgenic animals, and from this a population of antibodies may be prepared. Production of a human moncolonal antibodies humans with antigens, and the difficulties faced with immortalising B humans with antigens, and the difficulties faced with immortalising B cells are avoided. AAR29958 to AAR30666 and AAR34994 to AAR35056 represent sequences used in the exemplification of the present invention. The present invention describes a method (M1) for producing a human antibody phage display library (I), comprising: (1) providing a nonhuman transgenic animal (II) whose genome comprises human immunoglobulin genes; (2) isolating nucleic acids encoding human antibody chains (III) from lymphatic cells; and (3) forming a library of display packages whose members comprises a nucleic acid encoding (III) which is displayed from the package. The method is used for producing a human antibody display library, e.g., a Fab phage display library. The display method may be the method acids encoding antibody chains obtained from Producing a human antibody phage display library comprises providing a transgenic animal whose genome comprises human immunoglobulin genes and isolating nucleic acids encoding antibody chains from lymphatic cells immunised nonhuman transgenic animals, and from this a population of antibodies may be prepared. Production of a human monoclonal antibodies display library using this method means there is no need to immunise humans with antigens, and the difficulties faced with immorralising B cells are avoided. The invention relates to sequences of at least two nucleotides of formula:

(X) m5 - (alpha)n-beta-N3'; or (X) m5' - (gamma)k-delta-N3'; where X = a labelled compound and/or a nucleotide with voluntary sequence; m = 0 or 1; alpha = thymine; n = natural number indicating the repetition of alpha; beta, delta = V or Ni; V = adenine, gamma = thymine or cytosine; N = adenine, guanine, cytosine or thymine; gamma = thymine; gamma = thymine; which thymine expressed by gamma is composed of 1/3 or less of adenine, guanine and/or cytosine. The new nucleotides are useful as primers for RT-PCR and determination of base sequences. The new sequences allow for reproductive and highly efficient analysis of gene sequences.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     ö

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        This invention describes a novel method for identifying an inhibitor potentially useful for treatment of cancer, where the inhibitor is active on a gene vital for cell growth or viability, and where the gene is subject to loss of heterozygosity (LOH) in a cancer. The inhibitor is used for preventing the development of cancer in a patient having a precancerous condition, by administering to the patient a first allele specific inhibitor (ASI) targeted to an allele of a first essential gene present in cells of the precancerous condition, where the normal somatic cells of the patient are heterozygous for the first gene, the inhibitor is active on at least one but less than all allelic forms of the gene
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             present in a population and targets only one allelic form present in the normal somatic cells, and the first gene. The products and methods can be used in the diagnosis, previous and treatment of LOH disorders, e.g. cancers, atherosclerotic plaques, premalignant metaplastic or dysplastic lesions, benign tumours, endometriosis, polycystic kidney disease, and graft versus host disease. The method can also be used to remove malignant cells from bone marrow transplants. AAZ5812-Z26825 represent human polymorphic sites described in the method of the

The present invention relates to a method for treating a patient diagnosed as having a lower than normal high density lipoprotein-cholesterol (HDL-C) level, a higher than normal triglyceride level, or a cardiovascular disease, involving administering a compound that modulates LXR- or RXR-mediated transcriptional activity or ABC1 expression or activity. The LXR gene product may be used in an assay to identify compounds useful for the treatment of a disease or condition selected a lower than normal HDL cholesterol level, a higher than normal triglyceride level, and a cardiovascular disease.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Treating a lower than normal high density lipoprotein-cholesterol (HDL-0) level, a higher than normal triglyceride level, or a cardiovascular disease, by administering a compound that modulates LXR-or RXR-mediated transcriptional activity
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Homo sapiens fetal kidney clone AK647 secreted protein gene 3' end.

This invention describes nucleoside derivatives (I) with photolabile protecting groups. (I) are used to synthesize oligonucleotides using the photolithographic nucleic acid chip method, particularly where these are intended for performing enzymatic reactions initiated from a free reactions, but also reverse transcription, cDNA synthesis etc.), also for hybridization testing, sequenoing and in DNA computing. (I) are produced with high selectivity by reaction with a mild acylating agent that has high specificity for the 3'-position, without significant side-reactions (cf. more reactive acylating agents such as
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Branched compounds useful in e.g. nucleic acid synthesis reaction comprises nucleic acid moieties optionally extended by a polymerase

                                                                                                                                                                                                                    The sequence is that of the 3' end of a sequence encoding a secreted protein from a human fetal kidney clone AK296. Such a sequence is predicted to have biological activities which would make them suitable for treating, preventing or ameliorating medical conditions in humans and animals, although no autivity, cytokine and cell proliferation/differentiation activity, immune stimulating (a. as vaccines) or suppressing activity, activity, activity, chemotactic/chemokineic activity, activity, chemotactic/chemokineic activity, activity, chemotactic/chemokineic activity, add thrombolytic activity, receptor/ligand activity, anti-inflammatory and thrombolytic activity, receptor/ligand activity, anti-inflammatory inhibition activity, respectiviliqued activity, anti-inflammatory inhibition activity. It is also stated to be useful for gene
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     DNA chip; primer; nucleoside derivative; photolabile protecting group; photolithographic nucleic acid chip; ss.

fluorescence. Upon hybridisation to the complementary target sequence there was an increase in fluorescence yield, measured as the ratio of the fluorescence emitted by the hybrid between the ODN-MGB-LF conjugate and its target sequence to the fluorescence emitted by unhybridised (i.e. single-stranded) ODN-MGB-LF, of 8.3.

acid moieties optionally extended by a polymerase. The branched chain compounds of the invention are used in nucleic acid synthesis reaction, primer extension reaction, reverse transcription reaction of RNA into DNA, nucleic acid hybridization experiment (for identifying sequence a nucleic acid), and nucleic acid amplification experiment (for analysing the expression pattern of genes). The compounds are also used in solid-phase enzymatic reactions. The present sequence was used in the course of the invention to produce branched chain compounds.
                                                                                                                                                                Gaps

The present sequence is that of an oligonucleotide (ODN)-minor groove binder (MGF) complex. MGBs bind in a non-intercalating manner to the minor groove of non-single-stranded DNA, RNA or their hybrids. ONN-MGB-LF conjugates of the invention also comprises a latent fluorophore (LF), which binds similarly to the MGB but in an intercalating manner, or lies in the minor groove, or is oriented in some other way to the DNA molecule by MGB, such that it becomes fluorescent (or its fluorescent properties change detectably). The conjugates are used as hybridisation probes and amplification primers for fluorescent detection of specifically hybridising sequences, for analysis or diagnosis, especially (real-time) PCR, for single-nucleotide mismatch discrimination, target or signal amplification, array-based assays and sequencing, including

single-nucleotide mismatch discrimination

Disclosure; Page 58; 105pp; English.

The present sequence is that of the oligonucleotide (ODN) component of an ODN-MGB (minor groove binder)-LF (latent filuorophore)
Conjugate of the invention. MGBs bind in a non-intercalating manner to the minor groove of non-single-stranded DNA, RNA or their hybrids, while a LF binds similarly but in an intercalating manner, or lies in the minor groove, or is oriented in some other way to the DNA molecule by MGB, such that it becomes fluorescent (or its fluorescent properties change detectably). The conjugates are used as hybridisation probes and amplification primers for fluorescent detection of specifically hybridising sequences, for analysis or diagnosis, especially (real-time) PCR, for single-nucleotide array-based assays and sequencing, including detection, of double-stranded DNA by triplex formation. Many different targets can be detected a single reaction vessel. The present ODN-MGB-LF

                                                                                                 0
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     The present invention relates to an analytical support, to which a number of oligonucleotides are fixed. The oligonucleotides are labelled with a fluorescent compound, the fluorescence of which varies when the oligonucleotide hybridises to its complement. The analytical support is useful in hybridisation testing for identification of specific nucleic acids, such as genomic sequencing, detecting mutations or pharmaceutical development. The present oligonucleotide was used to illustrate the
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      /mod_base= OTHER

This invention relates to oligonucleotide analogues comprising a protein nucleic acid molecule (PNA) monomer. They are used in the detection and separation of nucleic acid molecules and as probes, primers, linkers, adapters and antisense agents on solid supports. Modifications enhance their use as capture and detection probes e.g. by the incorporation of biotin, digoxigenen, radioiscopes, fluorescent labels such as Iluorescein and reporter molecules such as alkaline phosphatase. They are also used for enhancing or inhibiting the activity of an enzyme proteases, have high affinity, binding specificity and solubility. The polyamide backbone of PNAs is resistant to both nucleases and proteases. PNAs bind nucleic acid molecules with greater affinity than DNA or RNA concentration. The compounds are relatively simple to synthesize and are used in a wide variety of applications. This sequence the thermal represents a DNA oligomer which is used to represent the thermal
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Gaps

The invention relates to a novel assay for detecting a polymucleotide in a sample, which comprises: contacting a sample suspected of containing a carget polymucleotide with a predetermined single-stranded sensor carget polymucleotide complementary to the target polymucleotide, in a solution comprising an agent that is a nonaqueous solvent that allows the sensor polymucleotide; and detertable fluorescence emission, exciting the sensor polymucleotide; and determining fluorescence emission. The assay is useful for detecting a single or double-stranded target colymucleotide, such as, DNA or RNA in a sample. The assay finds use in a view variety of different applications including pharmacogenetic testing, wide variety of different applications including pharmacogenetic testing, control of dentify the species or individual which was the forensic specimen, in anthropological setting, paternity compatibility between prospective tissue or blood concre and patients and in screening for hereditary disorders. The method concre and patients and in screening for hereditary disorders. The method is also useful to study alterations of gene expression in response to a stimulus, disease, drug or medication, and other applications include characterisation of human haplotype diversity. The method is useful for detecting polymucleotide sequences from contaminants or pathogens contautions polymorphisms, which may be associated with particular alleles or subsets or alleles. The method is useful for detection of mutations and to detect culcular applications expenses to disorders including cystic fibrosis. Tay-Sachs, and sickle-cell anaemia. This polymucleotide sequence represents an oilgonucleotide sequence represents an ail sickle-cell anaemia. This polymucleotide sequence represents an oilgonucleotide sequence represents an and sickle-cell anaemia.

The present invention describes mucleic acid molecules which modulate the synthesis, expression and/or stability of a mRNA encoding 1 or more receptors of vascular endothelial growth factor (WEGF). A patient (preferably human) having a condition associated with the level of the fims-like tyrosine kinase 1 (IL-1), kinase insert domain containing angiogenesis, ocular diseases, psoriasis and rheumatoid arthritis) can be treated by administering the nucleic acid molecule or the expression vector to the patient. AAX67275 to AAX75752 represent specific examples of nucleic acid molecules from the present invention.
                                                                                                          Vascular endothelial growth factor receptor; VEGF receptor; flt-1; flk-1; KDR; hammerhead ribozyme; hairpin ribozyme; cleavage; tumour angiogenesis; psoriasis; rheumatoid arthritis; ocular disease; fms-like tyrosine kinase 1; kinase insert domain containing receptor;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Nucleic acid molecule modulating VEGF receptor(s) gene expression or mRNA stability - useful for treating e.g. tumour angiogenesis, psoriasis, rheumatoid arthritis, etc., in a human patient
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Vascular endothelial growth factor receptor; VEGF receptor; flt-1; flk-1; KDR; hammerhead ribozyme; hairpin ribozyme; cleavage; tumour angiogenesis; psoriasis; rheumatoid arthritis; ocular disease; fms-like tyrosine kinase 1; kinase insert domain containing receptor;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Gaps

This sequence represents a primer of the invention. The invention relates to sequences of at least two nucleotides of formula:

(X) ms^5 - (alpha)n-beta-Ns', or (X)ms^5 - (gamma)k-delta-Ns', where

X = a labelled compound and/or a nucleotide with voluntary sequence;

m = 0 or 1; alpha = thymine; n = natural number indicating the repetition

M = 0 or 1; alpha = thymine; n = adenine, gamma = trymine;

N = adenine, gaunine or cytosine or thymine;

k = natural number of 3 or over indicating the repetition of gamma, in which thymine expressed by gamma is composed of 1/3 or less of adenine,
                                                                                                                                                                                                                                                     AAV49503-V49507 are primers used in the isolation of a human eosinophil cell activator. This protein and antibodies gamerated from the protein can be used for treatment and diagnosis of malignant tumours, parasitic inflections, allergic inflammation, eosinophilic pneumonia, rapid onset eosinophila, and autoimmune diseases. DNA can be used for diagnosis, and the antisense DNA in gene therapy of these disorders. The protein can be used for screening of potential agonists or antagonists of its
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               RT-PCR primer; DNA sequence determination; gene sequence analysis; ss.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           ò
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        The present invention describes nucleic acid molecules which modulate the synthesis, expression and/or stability of a mRNA encoding 1 or more receptors of vascular endothelial growth factor (VEGF). A patient (preferably human) having a condition associated with the level of the fins-like tyrosine kinase 1 (flt-1), kinase insert domain containing receptor (KDR) and/or foetal liver kinase 1 (flk-1) (e.g. tumour angiogenesis, ocular diseases, psoriasis and rheumatoid arthritis) can be treated by administering the nucleic acid molecule or the expression vector to the patient. AAX67275 to AAX75752 represent specific examples of nucleic acid molecules from the present invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         .

WPI; 2000-687341/67.

Pollenosis-associated gene 581 undergoing significantly low expression in subjects with high cedar pollen-specific IgE levels, useful in diagnosis of allergic diseases and screening drug candidates

Example 6; Page 39; 69pp; Japanese.

The invention relates to the human pollinosis-associated gene 581 which exhibits significantly reduced expression in the T-cells of individuals with high cedar pollen-specific IGE (immunoglobulin B) levels. The gene was isolated from T-cells from individuals allergic to cedar pollen using the differential display method. The invention also relates pollen using to the protein encoded by pollinosis-associated gene 581; to expression constructs and host cells comprising pollinosis-associated gene 581; to expression nucleic acids; pollinosis-associated gene 581 primers and probes; or antibodies against the protein encoded by the gene; methods of detection of pollinosis-associated gene 581 nucleic acids; and a method of cid pollinosis-associated gene 581 nucleic acids. The invention additionally encompasses methods of screening the expression of pollinosis-associated gene 581 nucleic acids. The invention additionally encompasses methods of screening the expression of pollinosis-associated gene 581 in pollen control. Pollinosis-associated gene 581 in pollen control. Pollinosis-associated gene 581 in the lagnosis of a control. Pollinosis-associated gene 581 is useful in the diagnosis of a lergic diseases and in the screening of drug candidates for the reatment of such diseases. The present sequence represents a PCR primer custom the isolation of human pollinosis-associated gene 581 cDNA.

The invention relates to the human pollinosis-associated gene 513 which exhibits significantly reduced expression in the T-cells of individuals with high cedar pollen-specific IGE (immunoglobulin E) levels. The gene with high cedar pollen-specific IGE (immunoglobulin E) levels. The gene was isolated from T-cells from individuals allergic to cedar pollen cusing the differential display method. The invention also relates to methods of detection of pollinosis-associated gene 513 nucleic acids; and method of dagnosis of allergic diseases via the detection of pollinosis-associated gene 513 nucleic acids; and methods of screening drug candidates for the treatment of allergic disease by measuring the cypression of pollinosis-associated gene 513 in pollen antigen-stimulated companies of a test compound relative to a control.

Pollinosis-associated gene 513 is useful in the diagnosis of allergic diseases and in the screening of drug candidates for the treatment of such diseases. The present sequence represents a PCR primer cused in the isolation of human pollinosis-associated gene 513 cDNA. Length 17; / Match

The invention relates to the human pollinosis-associated gene 419 which exhibits reduced expression in the T-cells of individuals with high cedar CC pollen-specific IgE (immunoglobulin E) levels. The gene was isolated from the formation of the control of the protein encoded by pollinosis gene control of the invention also relates to the protein encoded by pollinosis gene the invention also relates to the protein encoded by pollinosis gene and probes; antibodies against the protein encoded by the gene; methods of detection of pollinosis-associated gene 419 mucleic acids; pollinosis-associated gene; methods of diagnosis of allergic diseases via the detection of pollinosis-associated gene 419 nucleic acids. The invention additionally encompasses of disease by measuring the expression of pollinosis-associated gene 419 in collinosis-associated gene 419 in the present of allergic pollinosis-associated gene 419 in the present of allergic collinosis-associated gene 419 in the present sequence represents a proportion of the treatment of such diseases. The present sequence represents
                                                                                                                                            PCR anchor primer, SEQ ID NO:2, used in human gene 419 isolation.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Pollinosia-associated gene 419 undergoing significantly low exp in subjects with high cedar pollen-specific IgB levels, useful diagnosis of allergic diseases and screening drug candidates -
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Obayashi M,

The invention relates to the human pollinosis-associated gene 373 which exhibits significantly reduced expression in the T-cells of individuals with high cedar pollen-pecific IgE (immunoglobulin E) levels. The gene was isolated from T-cells from individuals allergic to cedar pollen cases to the protein encoded by pollinosis gene 373; expression constructs and host cells comprising pollinosis associated gene 373 nucleic acids; pollinosis-associated gene 373 primers and probes; antibodies against the protein encoded by the gene; methods of detection of pollinosis-associated gene 373 primers and probes; constructs and sandrated gene 373 primers and probes; antibodies against the protein encoded by the gene; methods of detection of pollinosis-associated gene 373 nucleic acids. The invention additionally encompasses methods of screening drug candidates for the treatment of allergic disease by measuring the expression of pollinosis-associated gene 373 in pollen context. a control. Pollinosis-associated gene 373 is useful in the diagnosis of allergic diseases and in the screening of drug candidates for the treatment of such diseases. The present sequence represents a PCR primer used in the isolation of human pollinosis-associated gene 373 cDNA.

Human, pollinosis-associated gene 795, vimentin homologue, IgB; immunoglobulin E; cedar pollen allergy, T-cell; reduced expression, detection; diagnosis; drug screening; allergic disease; PCR primer; ss.

```
The invention relates to the human pollinosis-associated gene 795 which exhibits significantly reduced expression in the T-cells of individuals with high cedar pollen-specific ISE (immunoglobulin B) levels. The gene was isolated from T-cells from individuals allergic to cedar pollen using the differential display method. Pollinosis-associated gene 795 has homology with the human vimentin gene. The invention also relates also relates to the protein encoded by pollinosis-associated gene 795 constructs and host cells comprising pollinosis-associated gene 795 nucleic acids; pollinosis-associated gene 795 primers and probes; antibodies against the protein encoded by the gene; methods of detection of pollinosis-associated gene 795 nucleic acids; and a method of diagnosis of allergic diseases via the detection of pollinosis-associated gene 795 nucleic acids; and a method of screening drug candidates for the treatment of allergic diseases by measuring the expression of pollinosis-associated gene 795 in pollen artigen-siscociated gene 795 in the presence of a test compound relative to antigen-stimulated T-cells in the presence of a test compound relative to antigen-stimulated gene 795 is useful in the diagnosis of allergic diseases and in the screening of drug candidates for the creatment of such diseases. The present sequence represents a PCR primer compare the present sequence represents a PCR primer compare the present sequence represents a PCR primer compared gene 795 cDNA.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        ð
                                                                                                                                                                                                                                                                                                                                                                                              This invention describes novel DNA sequences preferentially expressed in 19A nephropathy patients, and DNA sequences stringently hybridizing to them. Independent claims cover diagnostic reagents for 19A nephropathy incorporating the antisense sequences; the treatment of 19A nephropathy incorporating the antisense sequences for mRNA inhibition; proteins associated with 19A nephropathy, containing sequences encoded by the DNA sequences; antibodies recognizing these proteins; the production of the proteins by culture of host cells transformed with DNA encoding them, diagnostic reagents for 19A nephropathy containing the antibodies, and compositions for the treatment of 19A nephropathy which contain the antibodies. The products of the invention can be used for the diagnosis and treatment of 19A nephropathy. This sequence reperseants a primer used in the isolation and identification of the human 19A nephropathy—associated proteins
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        ö

This sequence represents a PCR primer used in the identification of a human pollanosis associated gene. The gene is highly expressed in individuals with high pollen-specific immunoglobhlin E (IGB) levels. The invention relates to the nucleotide sequence encoding the pollenosis associated protein, diagnosing pollenosis and screening candidate compounds for treating pollenosis. The gene can be used in diagnosing compounds for pollenosis treatment.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           The present invention describes nucleic acids (A) that interact stably with a target sequence and contain at least one phosphoro(di)thioate link, having endonuclease activity. (A), and more generally any catalytic nucleic acid (A') that modulates expression of the oestrogen receptor gene, are used to treat cancer (particularly of breast or endometrium), in vivo or by transforming cells ex vivo and implanting
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Oestrogen receptor hammerhead ribozyme target sequence SEQ ID NO:1947.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Oestrogen receptor; c-raf; k-ras; bcl-2; ribozyme; cleavage; hammerhead ribozyme; hairpin ribozyme; antisense oligonucleotide; gene expression modification; cancer; phosphorothioate; endonuclease;

nucleic acids that interact, and optionally cleave, target sequences, used to treat cancer

Claim 77; Page 79; 148pp; English.

Ð The present invention describes nucleic acids (A) that interact stably with a target sequence and contain at least one phosphoro(di)thioate link, having endomuclease activity. (A), and more generally any catalytic nucleic acid (A') that modulates expression of the oestrogen receptor gene, are used to treat gnarticularly of breast or endometrium), in vivo or by transforming cells ex vivo and implanting treated cells, or for other conditions associated with levels of oestrogen receptor. Because of the high selectivity for targeted RNA, (

Measuring expression of low abundance reduced complexity target nucleic acid molecules -

Example 3; Page 91; 187pp; English.

AAZ36739-41 represent oligo(dT) primers used for modified differential display, in the method of the invention. The specification describes a method for measuring the level of two or more nucleic acid molecules in a target. The method comprises contacting a probe with an arbitrarily or statistically sampled target and detecting the amount of specific binding of the target to the probe. The methods can be used to identify differentially expressed nucleic acid molecules associated with disease states, such as cancer, autolimmune disease, infectious disease, aging, developmental disorder, proliferative disorder or neurological disorder.

Alternatively the methods can be used to assess the efficacy or toxicity of or a resistance to a treatment. Also the methods can be used to determine differential expression of nucleic acid molecules in response to a stimulus, e.g. a chemical, drug or growth factor (especially epidermal growth factor), radiation, stress or a pathogen. The methods can also be used to determine co-regulated genes that can be potential
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      This invention describes a novel nucleic acid molecule comprising a sequence (I) which undergoes significantly low expression in subjects after pollen scattering, and is useful in diagnosis of allergic diseases and screening candidate compounds for remedies capable of regulating the response of I cells to the stimulus by an antigen.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    ŝ

```
The invention relates to the human pollinosis-associated gene 787 which exhibits significantly reduced expression in the T-cells of individuals after the pollen-scattering season, relative to expression levels in T-cells before the pollen-scattering season. The gene was isolated from T-cells from individuals allergic to pollen using the differential from Insplay method. The invention also relates to pollinosis-associated gene 787 primers and probes, methods of detection of pollinosis-associated gene 787 nucleic acids, and a method of diagnosis of allergic diseases via the detection of pollinosis-associated gene 787 nucleic acids. The invention additionally encompasses a method of screening drug candidates for the treatment of allergic disease by measuring the expression of pollinosis-associated gene 787 in pollen antigen-stimulated T-cells in the presence of a test compound relative to a control. Pollinosis—sociated gene 787 is useful in the diagnosis of allergic diseases and in the screening of drug candidates for the treatment of such diseases. The present sequence represents a PCR primer used in the isolation of human pollinosis-associated gene 787 cDNA.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           0
                                                                                                                                                                                                                                                                                                                                                                                                                                                                 ŝ
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Pollinosis-associated gene 787 undergoing significantly low expression
in subjects after pollen scattering, useful in diagnosis of allergic
diseases and screening candidate compounds to regulate response of T
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Gaps

The present invention describes the human pollinosis-associated gene 465 which has a nucleic acid sequence of 3442 base pairs (bp), given in 6ACG2221), that undergoes significantly low expression in subjects after pollen scattering and is useful in the diagnosis of allergic diseases and screening candidate compounds for remedies capable of regulating the response of T cells to the stimulus by an antigen. The gene is useful in the diagnosis of allergic diseases and screening candidate compounds for remedies capable of regulating the response of T cells to the stimulus by an antigen. The present sequence represents a PCR primer which is used in an example from the present invention.
                                                                                                                                                                                                                                                                                                                                                                                                              Pollinosia-associated gene 465 undergoing significantly low expression in subjects after pollen scattering, useful in diagnosis of allergic diseases and screening candidate compounds to regulate response of reals to antigen stimulus
                                                         Human pollinosis-associated gene 465 related PCR primer SEQ ID NO:2.

The invention provides a method of diagnosis of allergies that involves assaying the levels of expression of genes B1001, B1466, B1072 or B1151 in T-cells; and comparing them with the level of expression in healthy T-cells. The method is useful for diagnosing allergies, particularly atopic dermatitis. The present sequence represents a PCR primer used for analysis of the expression of the above genes.

The method is for examining allergic diseases, particularly atopic dermatitis, which is also applicable in screening candidate compounds for remedies, The present sequence is an anchor primer described in the exemplification
The present invention relates to a method of examining allergic diseases which comprises comparing the expression level of gene B1153 in allergy patients with the expression level in healthy subjects. The method is useful for the treatment, prevention, diagnosis and study of allergic diseases including atopic skin inflammation and asthma. The present sequence is a PCR primer described in the exemplification of the

                                                                                                                                                                                                                                                                                                                                                                                                                                                         The specification describes a method for examining allergosis. The method comprises measuring the expression level of the gene given in ABL59037, and comparing it with the expression level of the gene in the eosinophils of a healthy person. The method is used for the examination of allergosis. The present sequence represents a PCR primer, which is used in the course of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Human; allergy; atopic dermatitis; eosinophil; anti-allergic; PCR;

The present invention relates to a method for examining allergic diseases which involves determining the expression level of a gene, having one of the 17 nucleotide sequences shown in ABN99812-ABN99828, in the cosinophils in a patient and comparing the expression level with that in the evainophils of a healthy individual. The method can be used to examine allergic diseases, particularly atopic dermatitis, and its early diagnosis, which is also applicable in screening candidate compounds for exemplification of the invention.
                                                                                                                                                                                                                                    Method for examining allergic diseases by differential display of seventeen genes showing different expression particularly significant increase in eosinophils in patients with mild atopic dermatitis, also applicable in screening compounds
                                                                                                        (GENO-) GENOX RES INC.

The invention relates to a method for examining allergic diseases comprises determining the expression level of a gene containing, the human offn appearing as ABK49633 which has homology with acetyltransferases in the eosinophils of a patient and comparing the expression level with that in the eosinophils of a healthy individual (i.e. differential display). Also included are methods of screening for candidate compounds which affect the expression level of the gene or the activity of the protein encoded by the gene (including related proteins and mutants), the use of probes based on the gene sequence on the examination of allergic diseases, the use of reporter containing a the transcription-controlling region of the gene, cells transformed with the vector, an antibody against the protein and a model animal for allergic diseases which is a transgenic non-human vertebrate with allergic diseases which is a transgenic non-human vertebrate with the method is examining allergic diseases particularly atopic compounds for remedies. Such method can be performed in high throughput, at low cost. The present sequence is a differential display PCR primer vertebrate and the cDNA encoding the human acetyltransferase-like protein 20-90-05.
                      Examining allergic diseases by differential display of gene showing different expression particularly increased expression in remission stage in eosinophils of patients, also applicable in screening
                                                                                                                                                                72pp; Japanese.

having a role in various cellular processes. The method is useful for the analysis and identification of transcribed genes, and fingerprinting. The method can be used to identify genes which play a role in determining various cellular processes, including susceptibility to external factors, development, and disease. The present sequence for a PCR primer is used in the production of a single pattern characteristic of a sample, employing a Type IIS restriction enzyme (i.e. FokI) in the methods of the present invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Aspergillus phoenices, for degrading oxalic acid, identifying transformed plant cells, and preventing pathogenic disease in plants
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        The present sequence is that of a primer used in the invention. The invention relates to a novel nucleic acid (see ABZ70560) encoding Aspergillus phoenices oxalate decarboxylase (APOXD) (see ABP72475). The gene and its encoded protein are useful in degrading oxalate, in diagnostic assays, for protecting plants
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       New isolated nucleic acid encoding oxalate decarboxylase from

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Providing mRNA profile, by generating two independent patterns characteristic of sample mRNA population, analysing patterns, comparing gene expression by cell types under varied conditions, and identifying
                                                         This invention relates to gene sequences that are differentially expressed in eosinophils from patients with atopic dermatitis in the increment stage as compared with those in the remission stage. These sequences are used in a novel method to examining allergic diseases comparing the expression levels of these genes and comparing the expression level with that in the eosinophils of a healthy individual. The method of the invention may have antiallergic or dermatological activities. The method can be used to diagnose allergic diseases particularly atopic dermatitis, and may also be used to screen candidate compounds for remedies. The method of the present sequence represents the GTISa PCR primer used to amplify the differentially amplified atopic dermatitis related cDNA sequences
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     The present invention relates to a method for providing a profile of mRNA molecules present in a sample. The method comprises generating two independent patterns characteristic of the population of mRNA molecules expressed in the sample and analysing the patterns using a combinatorial algorithm, comparing gene expression by different or same cell types under different conditions, and identifying genes
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               5'-PCR primer used to produce single pattern characteristic by FokI.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Identification of transcribed gene; mRNA profile; gene expression; cellular process; fingerprinting; susceptibility to external factor; development; disease; PCR; primer; ss.

This is the nucleotide sequence of a PCR primer used in the method of the invention, involving the use of novel apoptosis-related DNAs and proteins. The inventions can be used as diagnostic reagents for apoptosis e.g. (monoclonal) antibodies for the protein, as a reagent in immunohistological staining, as apoptosis inhibitors. It can also be used for treatment of apoptosis-related diseases.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        PCR; primer; amplification; apoptosis; antibody; inhibition; ss; immunohistological staining.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      The inventors claim DNA fragments capable of expressing, in a host, a prod. contg. at least one antigenic determinant of papillomavirus (PV), (see AAN30170-1030173). Also claimed are immunogens consisting of at least one peptide sequence coded for by the DNA fragments (see AAP30310-P30313), vaccines contg. the immunogens and antibodies raised from them. The vaccines are useful in human and veterinary medicine and the antibodies are useful as diagnostic reagents. The DNA fragments are most esp. derived from the L1 region of human PV type
                                                                                                                          Sequence derived from the L1 region of the bovine papillomavirus (bPV)

         This is the nucleotide sequence of a PCR primer used in the method of the invention, involving the use of novel apoptosis-related DNAs and proteins. The inventions can be used as diagnostic reagents for apoptosis e.g. (monoclonal) antibodies for the protein, as a reagent in immunohistological staining, as apoptosis inhibitors. It can also be used for treatment of apoptosis-related diseases.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  This is the nucleotide sequence of a PCR primer used in the method of the invention, involving the use of novel apoptosis-related DNAs and proteins. The invention relates to identification of genes and proteins of adipose tissue relating to obesity, particularly complications of visceral obesity including diabetes, hyperlipemia, hypertension, arteriosclerosis, hyperuricemia and sleep apnea syndrome. The genes (AAZ90631-633) and the proteins (AAY67598-Y67600) are used in the genetic diagnosis, prevention and treatment of adipose tissue related diseases. Sequences AAZ90640-51 represent PCR primers amplifying the human adipose

The present invention describes a method of producing binary sequence tags from nucleic acid fragments in a sample, involving incubating the sample with cleaving reagents, mixing offset adaptors with the sample, incubating with more cleaving reagents and mixing the sample with adaptor-indexers where the adaptors are coupled to binary sequence tags. The method is useful in sequence analysis, including analysis and comparison of gene expression, nucleic acid samples and genomes.
                                                                                                                                                                                                                                                                               Producing binary sequence tags, useful for analyzing nucleic acid sequence tags, gene expression or gene-expression patterns, involves generating nucleic acid fragments, which are mixed with offset adaptors
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Human cytomegalovirus; HCMV; virucide; cytomegalovirus infection; CMV;

```
The present invention relates to a new method for identifying compounds related diseases. The method of the invention comprises contacting a test compound with at least one of the cellular kinases RICK, RIP, Rinses Compound with at least one of the cellular kinases RICK, RIP, Rinses RICK-Interacting kinase, MKK3 and SREK-2 and detecting any change in kinase activity. The method of the invention can be used to treat and/or prevent CNV infections and related diseases. Oligonucleotides that can detect the specified kinases can also be used for diagnosis of infection. The present nucleic acid sequence represents human CMV reverse transcriptase (RT)-PCR primer TXN that was used in the methods of the invention for preparation of radioactively labelled cDNA probes.
                                                                                                                                                         infection, comprises contacting test compound with cellular kinase and detecting change in cellular kinase activity -
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Providing mRNA profile, by generating two independent patterns characteristic of sample mRNA population, analysing patterns, comparing gene expression by cell types under varied conditions, and identifying

```
mRNA molecules present in a sample. The method comprises generating two independent patterns characteristic of the population of mRNA molecules expressed in the sample and analysing the patterns using a combinatorial algorithm, comparing gene expression by different or same cell types under different conditions, and identifying genes for the analysis and identification of transcribed genes, and fingerprinting. The method can be used to identify genes which play a role in determining various cellular processes, including susceptibility to external factors, development, and disease. The present sequence for characteristic forms in the production of a single pattern.
                                                                                  The present invention relates to a method for providing a profile of
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  characteristic of a sample, employing a Type II restriction enzyme (i.e. HaeII) in the methods of the present invention.

New pyridylpyrimidine derivatives useful in the treatment or prevention of infectious disease e.g. Kuru syndrome and Creutzfeldt-Jacob disease

Example; Page 38; 96pp; English.

The invention relates to novel pyridylpyrimidine derivatives and methods of detecting prion infections and/or prion disease in an individual or in cells, cell cultures and/or cell lysates. The method involves adding at least one monoclonal or polyclonal antibody, oligonucleotide or pyridyleast one monoclonal or polyclonal antibody, oligonucleotide or pyridylysates and detecting the activity of at least one human cellular protein kinases (e.g., FGF-R1 (also known as flg, F1-1, F1t-2, b-FGFR), rk (also known as CCK-2, DDR-2 or BDDR, BC number 2.7.1.112), Abl (also known as CCK-1), PRK), human cellular protein phosphatases such as prp-SL cknown as CDK1), PRK), human cellular protein phosphatases such as prp-SL conjection as GPR ond GPIR-1. The invention is useful for regulating the composition for prophylaxis and/or treatment of infectious disease (e.g. production of prions in cells and in the manufacture of pharmaceutical composition for prophylaxis and/or treatment of infectious disease (e.g. TMB), Creutzfeldt-Jacob disease (CMD), transmissible mink encephalopathy (BSB), variant CJD, deretmann-Straussler-Scheinker syndrome (GSS), fatal cortinains (FRI), Kuru and Alpers syndrome, especially BSE, CJD, or ruminants. The present DNA sequence is a primer used to prepare composition of the invention. 886666666666666666666668888

```
This invention describes a novel recognition system comprising at least I recognition unit bound to a support, each recognition unit comprising region A with a defined structure adjacent to a region B with a randomized structure. The recognition system is useful for screening, identifying, or characterizing at least 1 component of a sample, identifying cellular or synthetic binding partners, preferably proteins, peptides, nucleic acids and/or proteins, and for screening for and/or peptides, nucleic acids, chemical agents, preferably proteins, pharmaceuticals, plant protection agents, toxins, venoms, carcinogens, teratogens, herbicides, fungicides or pesticides.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Recognition system, e.g. for identifying nucleic acids, comprises at least one recognition unit comprising a region with a defined structure adjacent to a region with a randomized structure.
                                                                                                                                                                                                                                                                       Recognition system; screening; identification; pharmaceutical; toxin; plant protection agent; toxin; venom; carcinogen; venom; teratogen; herbicide; fungicide; pesticide; beta-actin; human; ss.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               The sequence is a second reverse phase triplex forming oligonucleotide, RP-TRO (3' to the SNP) used to analyse Factor V Leiden SNP using the method of the invention. The invention relates to analysing target uncleic acid sequences comprising restricting isolated DNA, hybridising target nucleic acid sequences comprising restricting isolated DNA, hybridising car least one triplex forming oligonucleotide (TFO), adding a 3 to 5' exponuclease to form a protected nucleic acid sequence (PNAS) tail of structure, hybridising the captured structure with a single nucleotide polymorphisms (SNP) identification probe and determining the SNP score. The methods can be used for analysing target nucleic acid sequences, short tandem repeats (STRS). The methods can be used to detect SNPs for use in population genetics, drug development, forensics, cancer, genetic contains, plants and animals.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   .

The invention relates to a method for calibrating data scanned from a molecular array. The method involves employing calibration probes that generate signals proportional to the total concentrations of labelled target molecules to which the molecular array probes are directed over an entire range of sample solutions and molecular arrays incorporating acts of calibration probes. Method is useful for calibrating different types of signals scanned from a molecular array, or calibrating signals scanned from a molecular array, or calibrating signals scanned from different molecular arrays. The present sequence is poly (A) normalisation probe used in calibration of molecular array data.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Hepatitis B virus; HBV; infection; hepatocellular carcinoma; diagnosis;

This invention descibes a novel method for the analysis of a DNA fragment which comprises: (i) addition of a known common oligonucleotide sequence to at least one terminal of each DNA fragment. (ii) amplification of the resultant DNA fragment as a primer using a first common primer containing a complementary nucleotide sequence to the above mentioned known common oligonucleotide sequence, a second common primer containing a complementary nucleotide sequence to the prepared known common oligonucleotide sequence optionally having been introduced with common oligonucleotide sequence at a terminal, and a specific primer capable of hybridisation with a DNA fragment containing whole or part of the gene having known sequence, to give amplified DNA, (iii) analysis of the amplified DNA to find the information of the DNA fragment, in which the specific primer is designed to prepare fragments of the common first and second primers and to give short fragment of amplified DNA and (iv) labelling them to make their differentiation.
                                                                                                                               The invention relates to diagnosis of hepatitis B virus (HBV) infection stages comprising identification of full length HBV transcripts (I) and truncated HBV transcripts (II) in a serum sample, where the ratio of lift is indicative of a particular infection stage. The method is useful for diagnosing HBV infection stages and determining the risk for developing hepatocellular carcinoma. The present sequence is that of a HBV diagnostic PCR primer, useful for the invention.
              Diagnosing hepatitis B virus (HBV) infection stages and determining trisk for hepatocellular carcinoma, comprises identifying full length HBV transcripts and truncated HBV transcripts in a serum sample
                                                                                                                                                                                                                                                                                                                                                                             Gaps
                                                                                                                                                                                                                                                                                                                                                                           .;

Differentiation of informations of known and unknown genes readily provides information of unknown gene and simultaneous monitoring of signals derived from minor genes. Furthermore, labelling of DNAs according to functions of Known genes can be performed. AAZ09189-209201 represent oligonucleotide primers used to illustrate the method
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      The invention relates to a method for calibrating data scanned from a molecular array. The method involves employing calibration probes that generate signals proportional to the total concentrations of labelled target molecules to which the molecular array probes are directed over an entire range of sample solutions and molecular arrays incorporating sets of calibration probes. Method is useful for calibrating different scanned from anolecular array, or calibrating different scanned from different molecular arrays. The present sequence is poly (A) normalisation probe used in calibration of molecular array data.

The method involves employing calibration probes that generate signals proportional to the total concentrations of labelled target molecules to which the molecular array probes are directed over sets of calibration probes. Method is useful for calibrating different types of signals scanned from a molecular array, or calibrating signals scanned from anolecular array, or calibrating signals scanned from different molecular arrays. The present sequence is poly normalisation probe used in calibration of molecular array data.

The present sequence represents a specifically claimed oligonucleotide PCR primer. The oligonucleotide can be used for polymerase chain reaction (PCR) amplification of DNA, specifically regions of specific genes that are conserved among mammalian species, i.e. pairs of oligonucleotides from the present specification represent universal mammalian sequence-tagged site (UM-STS) primers. The primers are used to develop genomic maps, to include clones from libraries, to make cross-species comparisons and to develop additional genetic marker. UM-STS allow genomic comparisons to be made between more species.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        primer; ss, liver regeneration, gene panel; expression profile, screening, drug development; hepatitis; liver transplantation.

                                                                                                                                                                                                                                                                                                                                                                                                                                                   Cleavage of nucleic acids using an enzyme, especially a nuclease selected from the group consisting of Cleavase (RIM) BN enzyme, C Thermus aquaticus DNA polymerase. Thermus thermophilus DNA polymerase. Escherichia coll ExoIII and the Saccharomyces cerevisiae polymerase, Becherichia coll ExoIII and the Saccharomyces cerevisiae and I/O complex. The nucleic acid substrate is preferably an alternatively, microbial gene sequences. Cleavage products are compared to the cleavage products of reference gene sequences. The method is used for detecting mutation in the human p53 gene; for identifying strains of microorganisms, especially bacteria selected from the the group of members of the genera Campylobacter, Escherichia, Mycobacterium, Salmonella, Shigella and Staphylococcus. The method may also be used for the identification of viruses. The human tyrosinase gene (both wild type and mutant gene fragments) was used as a test sequence for the method. Three primers (AAT22069-82) were used alongside other primers (AAT27689-90) and in combination, to amplify fragments of wild type and mutant tyrosinase genes.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     ò

The invention comprises a gene panel constructed from the expression profile of known genes which show a change in expression level between normal liver cells and liver cells under regeneration. The gene panel is useful for providing expression data and screening/development of drugs for liver regeneration (e.g. when treating hepatitis, after transplantation or removal of the liver during cancer or hepatitis threapy). The present DNA sequence represents a PCR primer used in the
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Calpain; subunit; calcium; protease; mutation; treatment; detection; identification; diagnosis; limg girdle muscular dystrophy; LGMD2; calcium activated neutral protease; CANP; ss.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           The calpain large subunit I gene located on chromosome 15 codes for a calcium activated neutral protease (CANP3) belonging to the calpain family. Mutations in the gene induce limb-girdle muscular dystrophy (LGMD) 2 disease. The gene, and fragments of it, can be bredisposition to LGMD2 treatment, diagnosis and detection of a predisposition to LGMD2 disease. Fifty primers (AAT32510-59) were used to specifically amplify the exons and splice junctions of the calpain large subunit I gene as well as the regions containing the putative CAT, TATA boxes and the polyadenylation signal. Two primers (AAT32534, AAT32535) were used to amplify exon 12 of the gene.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Human novel Calpain large sub:unit 1 gene encoding a calcium dependent protease - used to develop prods. for the diagnosis treatment of limb-girdle muscular dystrophy 2 disease
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Primer for exon 12 of the calpain large subunit 1 gene.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Sequence 20 BP; 3 A; 1 C; 12 G; 4 T; 0 other;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                This invention describes novel antisense oligonucleotides (OGNS) (I) 88-20 nucleotides in length that specifically hybridize with and inhibit nucleic acids encoding human Fas-associated death domain (FADD), targeted to the 3' untranslated region (3'UTR). (I) can be used to treat animals, especially humans, suspected of having or being prone to a disease or condition associated with FADD expression. AAZ44746-Z44831 represent primers and probes used in the method of the invention.
                                                                                                                                                                                                                      FADD; human; antisense; inhibitor; Fas-associated death domain; primer;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Antisense oligonucleotides, useful for inhibiting human Fas-associated death domain (FADD) expression are targeted to the 3' untranslated region of the FADD gene

The sequence is a polypyrimidine oligonucleotide for binding a second reverse phase triplex forming oligonucleotide, RP-TFO, (3' to the SNP) to the target SNP used to analyse Factor V Leaden SNP using the method of the invention. The invention relates to analysing target nethod of the invention. The invention relates to analysing target at least one triplex forming oligonucleotide (TFO), adding a 3' to 5' exomuclease to form a protected incleic acid sequence (PNAS) tail structure, hybridising the captured structure with a single nucleotide structure, hybridising the captured structure with a single nucleotide collymorphisms (SNP) identification probe and determining the SNP score. The methods can be used for analysing target nucleic acid sequences, especially genomic DNA sequences, to determine if they contain SNPs or short tandem repeate (STRS). The methods can be used to detect SNPs or use in population genetics, drug development, forensies, cancer, genetic disease research, genomic analysis, diagnostics and therapeutics in humans, plants and animals.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Analysing target nucleic acid sequences, useful for population genetics, drug development and diagnosing cancer, comprises hybridizing triple forming oligonucleotide and probe to target sequence -

                                                                                                                                                                                                                                                                                                                                                                 Third-strand oligonucleotides (AAT48467-70) bind to a purine-rich region (see also AAT48455) located at position 2655 in the beta-globin gene (see also AAT48454). They can be utilised in a targetted DNA replacement (TDR) method to correct a mutation that leads to sickle cell anaemia. In TDR, a third-strand oligonucleotide is targetted to a binding region in the gene, where it induces DNA damage. This stimulates homologous recombination with an introduced donor nucleic acid strand. TDR is highly specific and, since the corrected gene

Ledley FD,

potentially useful for treatment of cancer, where the inhibitor is active on a gene vital for call growth or viability, and where the gene is subject to loss of heteroxygosity (LOH) in a cancer. The inhibitor is used for preventing the development of cancer in a patient having a precancerous condition, by administering to the patient having a precancerous condition, by administering to the patient having a present in cells of the precancerous condition, where the normal somatic cells of the patient are heteroxygous for the first gene, the inhibitor of a active on at least one but less than all allelic forms of the gene or present in a population and targets only one allelic form present in the normal somatic cells, and the first gene. The products and methods can commal somatic cells, and the first gene. The products and methods can be used in the diagnosis, prevention and treatment of LOH disorders, dysplastic lesions, benign tumours, endometricosis, polycyptic kidney disease, and graft versus host disease. The method can also be used to remove malignant cells from bone marrow transplants. AAZ25812-Z26825 crementic. Identifying target genes for allele-specific drugs - used for diagnosis, prevention and treatment of, e.g. cancers, atherosclerotic plaque, dysplastic lesions, endometricsis or graft versus host disease invention describes a novel method for identifying an inhibitor Disclosure; Figure 7; 605pp; English WPI; 1998-521232/44. Assay of genetic sequences based on triplex formation from double stranded analyte - and hybrid of anchor and reporter sequences, with reporter released if triplex formation occurs, used e.g. to identify bacteria

Disclosure; Columns 17-18; 168pp; English.

The present sequence represents a polynucleotide that is able to form a triple helix with a double stranded sequence. Cytosine bases in the present can be replaced with 5-methylcytosine for increased triplex stability. The present sequence is used in the assay of the sequence it can be part of the anchor DNA or reporter DNA sequence. The assay comprises adding a sample containing double-stranded by test sequences to an aqueous medium containing at least one complex of anchor DNA, attached to a solid support, and reporter DNA, where a triple-strand structure with part of the test sequence. Triplex formation results in displacement of the reporter DNA which is detected as an indication of the presence of the DNA test sequence. The method is used to detect DNA sequences, particularly for the method is used to detect DNA sequences, particularly for clientification of bacteria (by detecting genes for ribosomal RNA) in clinical samples, but also detection of oncogenes and Hepatitis B virus.

DNA containing intermediate tandem repeat sequences, in DNA profiling Isolating

Claim 30; Page 22; 111pp; English.

This sequence is a PCR primer for a human DNA marker clone used in the

```
method of the invention. The method is for isolating a fragment of DNA containing an intermediate tandem repeat (ITR) sequence using hybridization selection, and comprises: (a) providing several DNA fragments at least one of which contains an ITR sequence, a region of the DNA fragment which contains an ITR sequence, a region of the DNA fragment which contains a ITR sequence, a region of times; (b) providing a stationary support having at least two climes; (b) providing a stationary support having at least one oligonuclectide associated with it, where the oligonuclectide includes a sequence; and (c) combining the DNA fragments with the support under conditions where the DNA fragments including the DNA fragment containing used to isolate DNA containing pentanuclectide tandem repeat sequences as well as to detect target ITR DNA sequences having a low incidence of souther artifacts (no more than 2.4%). The method is useful in DNA profiling for linkage analysis, criminal justice, paternity testing and other forensic and medical uses. DNA typing is also useful for confirming the lineage of horses, dogs and other prize animals. The invention of constitution when method on the use of microsatellity of in DNA profiling 
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                0
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              electrophoretic gels. This allows the simultaneous analysis of more loci.
                                                                                                                                                                                                                                                                                                                                                                                                                                                          profiling. The method can detect polymorphisms with a low incidence of stutter artifacts, which has previously been a problem in interpreting allelic content of loci. The development of markers based on larger repeat units, enables easier separation of the fragments on
